WrightHere: Catalyzing Creativity with 3D-AI Immersive Environment

Catalyzing Creativity with
AI-infused 3D Interactive Environment
Designed for Children's StoryWriting

I am truly honored and delighted to share that **WrightHere** has recently received the 2026 iF Award. It received the award in the discipline of User Experience (UX) under the category Education / Creative Tools UX. This recognition reaffirms my belief that immersive play can serve as a powerful catalyst for children's creative confidence and imaginative storytelling.

WrightHere was conceived not simply as a writing tool, but as an immersive play platform where children step inside their own story worlds through extended reality, explore ideas through interaction, and return to text with renewed inspiration. *WrightHere* empowers children to build narrative worlds from imagination through meaningful human-AI co-creativity.

Through developing and testing with *WrightHere*, I have gained hands-on insight into designing immersive, AI-augmented creative experiences for children—balancing play, narrative structure, and technology. I would greatly value the opportunity to discuss how these experiences and learnings might meaningfully dedicate to your vision.
